AXOPROBE-1A Multipurpose Microelectrode Amplifier

SPECIFICATIONS

Note: Numbered items are detailed in the Table.

HEADSTAGES

Types: HS-2 series headstages are standard.

Voltage Gain: All headstages record voltage at a unity gain.

Headstage Current Gain (H): Select on basis of cell input resistance (R_{in}) and maximum current capacity (I_{max}).

$H = x 0.0001$ for ion-sensitive electrodes with current passing.

$H = x 0.01$ for R_{in} greater than approx. 300 M Ω .

$H = x 0.1$ for R_{in} approx. 30–300 M Ω .

$H = x 1$ for R_{in} approx. 3–30 M Ω .

$H = x 10$ for R_{in} approx. 0.3–3 M Ω .

These ranges suggested for optimum performance. Considerable overlap is allowable.

Extracellular Electrodes: Operate with any H value (but check I_{max} and Input Leakage Current).

Ionophoresis: Typically uses $H = x 1$.

⁽¹⁾**Current Setting and Measuring Resistance (R_o):** Located inside headstage. R_o determines H. R_o is not the input resistance.

⁽²⁾**Input Resistance:** Inversely proportional to H.

⁽³⁾ **I_{max} :** Maximum current that can be passed with input grounded via indicated sum of cell resistance (R_{in}) and electrode resistance (R_e).

Compliance Voltage: ± 30 V. Max voltage that can be applied across high-resistance electrodes.

⁽⁴⁾**Noise:** Values measured at V_e output with input grounded via R_o . Single-pole lowpass filter used to set measurement circuit –3 dB bandwidth. Capacitance Neutralization adjusted so step response of V_e is non-overshooting and so –3 dB bandwidth of v_e is equal to measurement circuit bandwidth.

Hum (Power Line Noise): Less than 20 μ V peak-to-peak, grounded input, input-referred.

⁽⁵⁾**10–90% Settling Time (t_{10-90}):** Two values shown; $t_{10-90,V}$ for voltage step applied to input via R_e ; $t_{10-90,I}$ for current step into same R_e . Capacitance Neutralization adjusted for fastest non-overshooting response.

Input Capacitance: Largely eliminated from step response considerations by bootstrapped power supplies and Capacitance Neutralization. See Settling Time specifications.

⁽⁶⁾**Capacitance Neutralization Range:** Ten-turn potentiometer. L version headstages have smallest range and lowest noise. M version headstages have larger range but more noise.

Capacitance Neutralization Leakage Current: Prevented by removal of DC potentials from neutralization capacitor and shield. Removal has 1 s or 10 s time constant.

⁽⁷⁾**Case/Shield:** Case and shield connector connected to Capacitance Neutralization or to unity-gain buffered electrode potential (V_e).

⁽⁸⁾**Input Leakage Current (I_{leak}) vs. Temperature.** Temperature dependence measured near 25°C. At fixed temperature input leakage current can be adjusted to zero.

PREAMPS (Two Channels)

Offset Range: ± 500 mV. Ten-turn potentiometers.

Electrode Resistance Compensation Range: $10 \div H$ M Ω /turn. Ten-turn potentiometers. Coupling resistance range, on ME1 control only, is $1 \div H_2$ M Ω /turn.

Test: For electrode resistance measurement. 100H mV/M Ω or H mV/M Ω . Res. Comp. must be off.

Clear: Forces ± 100 nA through electrode.

In Use/Standby: Microelectrode 2 amplifier only. In Standby position disables panel meter and Capacitance Neutralization circuit.

TABLE

PARAMETER	UNITS	HS-2 x 10M	HS-2 x 1M	HS-2 x 1L	HS-2 x 0.1L	HS-2 x 0.01M	HS-2M x 0.0001

BUZZ

Frequency: Approx 50 Hz–10 kHz. Logarithmic potentiometer.
Duration: Approx. 5–500 ms. Logarithmic potentiometer.
Amplitude: 0 to ± 30 V. Attenuated by input capacitance. Linear potentiometer.
Activation: Front-panel debounced switch, footswitches, or logic HIGH level on rear-panel connector.

OUTPUTS

- (⁹) I_1 and I_2 : Actual electrode currents. $10 \div H$ mV/nA.
- (⁹) **Current Meter:** Recognizes H of headstage in use and sets decimal point accordingly. Maximum meter reading is less than headstage current limit (I_{max}). Currents exceeding current meter range can be measured on I_1 and I_2 outputs. Display selections are I_1 and I_2 .
- Voltage Meters:** Range ± 1999 mV. Separate meters for V_1 and V_2 . V_1 meter also displays $V_1 - V_2$.
- V_e : Raw headstage voltage. 0.1%
- $10V$: $\times 10$ output with Resistance Compensation and Offset. 0.1%
- $10(V_1 - V_2)$: Difference of $10V_1$ and $10V_2$. Matched to 0.01%
- $100V$: $\times 100$ output. AC coupled (1 Hz). 2%.
- V_{BATH} : $\times 1$ bath potential. 1%
- Output Impedances:** 500Ω .
- (¹⁰) C_x **Compensation:** Used to compensate for the coupling capacitance between electrodes. ENHANCE position adds ME2 voltage via a capacitor into ME2 headstage input, thus matching electrode responses to common-mode signals. Used for ion-sensitive electrode recording. NEUTRALIZE position subtracts ME2 voltage from ME2 headstage input. Used for double-barrel current passing.

LOWPASS FILTERS

Two independent filters: F1, F2. Second-order.
-3 dB frequencies: Twelve. 2, 5, 10, 20, 50, 100, 200, 500, 1K, 2K, 5K, 10K Hertz. Continuous rotation.
F1 Inputs: Switch selected. $10V_1$, $10V_2$, $10(V_1 - V_2)$, V_{e1} , $100V_1$, I_1 .
F2 Inputs: Switch selected. $10V_1$, $10V_2$, V_{BATH} , V_{e2} , $100V_2$, I_2 .
Bypass Switch: In ACTIVE position signals are filtered. In BYPASS position signals are wideband.

INTERNAL COMMANDS

Note: Commands from all sources sum linearly.
DC Current Command: One for each preamp. $\pm 100H$ nA max. Ten-turn potentiometers.
Pulse Current Command: One for each preamp. $\pm 1000H$ nA max. Ten-turn potentiometers. Activated by HIGH control signal on PULSE GATE input or by front-panel switch.
Step Command: Shared by preamps. Destination switch determines which preamp command goes to. $\pm 199.9H$ nA max. Set on thumbwheel switch. Activated by HIGH control signal on STEP GATE input or by front-panel switch.

EXTERNAL COMMANDS

Sensitivities: $20H$ nA/V
Input Impedance: $100 k\Omega$
Max. Input Voltage: ± 30 V

CALIBRATION SIGNAL

Internal: Activated by HIGH control signal on CAL. GATE input or by front-panel switch. Input-referred values: 10 mV on $\times 10$ outputs, 1 mV on $\times 100$ outputs, $10H$ nA on I outputs.
External: Proportional to applied voltage. Input-referred values: 2 mV/V on $\times 10$ outputs, 0.2 mV/V on $\times 100$ outputs, $2H$ nA/V on I outputs. $100 k\Omega$ input impedance.
Accuracy: 1% typical.
Audio Monitor: Pitch proportional to V_1 or V_2 . Internal speaker bypassed when earphone plugged in.

BATH POTENTIAL SUBTRACTION

Signal recorded by bath headstage or by external amplifier is subtracted from $\times 10$ outputs. Subtraction band-limited to 10 kHz. If bath potential not measured system automatically reverts to using 0 V as reference potential. Standard headstages work as bath headstages if plugged into bath headstage connector.

GROUNDING

Signal ground is isolated from chassis and power ground.

CONTROL INPUTS

Above 3 V accepted as logic HIGH. Below 2 V accepted as logic LOW. Inputs protected to ± 15 V.

PAIRING BRACKET (BR-1)

BR-1 bracket (optional extra) for mounting two headstages as a pair.

HEADSTAGE DIMENSIONS

Case is $2.25 \times 1.14 \times 0.87$ " (57.2 x 29.0 x 22.1 mm). Mounting rod is 4 (102) long. Available mounting rod diameters (D) are $1/2$, $5/16$ or $1/4$ (6.3, 7.9 or 9.5). Specify required mounting rod diameter with order. Cable length is 10 feet (3 m).

HEADSTAGE CONNECTORS

Sockets for microelectrode input, shield drive and ground output are $0.08"$ (2 mm) diameter. Input socket is Teflon insulated.

CABINET DIMENSIONS

7 (177) high, 19 (483) wide, 12.5 (317) deep. Mounts in standard 19" rack. Handles included.

SUPPLY REQUIREMENTS

Line Voltage: 100–125 VAC or 200–250 VAC. User selectable by an internal switch.

Line Frequency: 50–60 Hz.

Power: 20 W.

Fuse: 0.5 A slow. 5 x 20 mm.

Line Filter: RFI filter is included.

Line cord: Shielded line cord is provided.

ACCESSORIES PROVIDED

Operator's Manual

Service Manual

2 mm plugs for use with headstage

Low-capacitance test resistor for each headstage

Spare fuse

Footswitches to operate Buzz of both electrodes.

ORDERING INFORMATION

When ordering please specify:

1. Current gain (H) and type of two headstages provided.
2. Current gain (H) and type of any extra headstages.
3. Diameter (D) of headstage mounting rods.

Unless you specify otherwise, the AXOPROBE-1A will be supplied with one HS-2 H = $x0.1L$ and one HS-2 H = $x1L$ headstage, each with D = $5/16$ (7.9 mm). Domestic and international sales are direct from the factory.

10% discount applies to simultaneous purchase of two or more AXOPROBE-1As by a single group. For non-simultaneous purchases, 10% discount applies to second and subsequent AXOPROBE-1As purchased by a single group within 12 months. Discount must be requested when placing order.

WARRANTY

12 months parts and labor from date of receipt.

SERVICE

Service is available at the factory. A detailed service manual is supplied with each AXOPROBE-1A.

For further information call us. A factory expert will be pleased to answer your technical and ordering inquiries.

AXON INSTRUMENTS, INC.

1429 Rollins Road Burlingame, CA 94010 U.S.A.

Phone: (415) 340-9988 / Telex: 677-1237

THEORY OF OPERATION

GENERAL

The AXOPROBE-1A contains amplifiers for two separate microelectrodes (ME1 and ME2).

Each channel is fully independent. The microelectrode is plugged into a small high-input-impedance headstage which is connected by cable to the main unit. The microelectrode voltage is recorded at the same time that current is passed. Command voltages are generated internally but timing must come from external sources.

For a complete description of the operation of the AXOPROBE-1A see the Operator's Manual.

POWER SUPPLY - ASSEMBLY NO. A1007

Located in the left-hand section of the instrument.

WARNING: Line voltages are present in the power-supply section.

The line input connector contains an RFI filter, the fuse in use and a spare fuse. A slide switch on the circuit board puts the two primary windings into series or parallel connection for 230 V or 115 V operation respectively. Line voltages from 200-250 V and 100-125 V AC are acceptable.

Five regulated outputs are generated: +50 V, -50 V, +15 V, -15 V, +5 V. Standard 3-terminal regulators are used. Test points on the circuit board allow the regulator input and output voltages to be conveniently measured. 2 mV of line-frequency noise and 2 mV of wideband noise are acceptable. This noise is rejected by the rest of the circuitry.

MICROELECTRODE 1 - ASSEMBLY A1006

Headstages

HS-2 series headstages are unity-gain buffers to convert the high-impedance microelectrode signal into a low-impedance signal for transmission to the main unit. A $5\text{ K}\Omega$ resistor protects the input from static discharges. Resistor R_0 is used for current setting and measuring. A trim pot allows the offset voltage to be adjusted. This is important for removing the input leakage current. Capacitor C_n is used for neutralizing the input capacitance. A resistor from the unity-gain buffer output removes the DC voltage from across C_n which would otherwise cause a leakage current to flow through the insulation resistance of C_n .

Headstage Power Supply

Constant current sources CRD3, CRD4 and transistors Q3 and Q4 comprise a floating $\pm 10\text{ V}$ power supply for the headstages. The transistors are arranged as amplified diodes to simulate 10 V zener diodes. The common point of the floating supply is driven by the electrode voltage (V_{1A}) buffered through A22. To modify the headstage supply for greater speed but less stability reduce C33 to 150 pF or less.

Capacitance Neutralization

A15 and A16 provide positive feedback to the headstage input through C_n . If relay RL4 is energized an oscillating voltage called Buzz is applied to the microelectrode through C_n .

C_x Compensation

Amplifier A31 adds a variable amount of the voltage on microelectrode 2 to the microelectrode 1 input through C_n . The polarity is either positive or negative depending upon whether enhancement or neutralization is selected, respectively.

Current Source

A26 and R_o (inside headstage) comprise a constant current source (CCS). The command voltage at the output of A24 is forced across R_o thereby setting the electrode current. The common mode rejection ratio of A26 is adjusted by RVT18.

Commands

Command voltages from several sources are summed in A24. V_R is a stable 5 V reference voltage used to establish the internal commands. V_T comes from the thumbwheel switch. U1 is a CMOS switch used to pulse the output of A23 and simultaneously light an LED. The gain of A24 is 3 or 0.3 depending on the source. The gain of A26 is 0.67. Thus the overall gain is 2 or 0.2.

Current Measurement

Differential amplifier A17 measures the buffered voltage across R_o . This voltage is scaled in A18 and supplied to the I_1 output.

Voltage Measurement

The output of A17 is amplified in A19 before connecting to the Resistance Compensation potentiometer. The wiper voltage of this potentiometer is proportional to the IR voltage drop across the microelectrode and is subtracted from the electrode voltage in A21. Offset compensation is done in A21. A calibration signal is added and the bath potential subtracted in A25. A divide-by-10 network on the output of A25 scales the x10 output for display on the digital panel meter.

The x100 output comes from A14. This amplifier is AC coupled.

The initial x10 gain for both the x10 output and the x100 output is done in A37. A sample-and-hold amplifier (A38) is used, under control of the experimenter, to prevent artifacts recorded by the electrode from being fed through to the outputs.

MICROELECTRODE 2 - ASSEMBLY A1006

This amplifier is similar to the microelectrode-1 amplifier. An In Use/Standy switch replaces the Display switch. In the Standby position the capacitance neutralization circuit is disabled. This prevents any unexpected oscillations from occurring in an open-circuited headstage. There is no C_x compensation circuitry, nor is there a sample-and-hold amplifier for blanking.

COMMON CIRCUITRY - ASSEMBLY A1006

Buzz Generator

The Buzz oscillation is gated by monostable U6. U6 is triggered by front-panel switches debounced in U4, or externally by footswitches or logic-level pulses. U6 simultaneously turns on an oscillator and activates the relay in the ME1 or ME2 section. The appropriate relay is selected in U4. Drive current for the relay coil comes from the Darlington transistors in U2. The oscillator consists of A33 and A34. The output amplitude ranges from zero to ± 30 V.

Step Command

The output of the Thumbwheel-to-Voltage Converter (assembly A1004) is changed from a continuous to a step voltage by CMOS switch U3. The CMOS switch is activated by the external STEP ACTIVATE input or by the front-panel switch after inversion in U2. The step voltage is routed to ME1 or ME2 by the Destination switch. The output of U2 also drives an LED selected by this switch.

Calibration Signal

The second switch in U3 is activated by the external CAL ACTIVATE or by the front-panel switch. The 5 V reference voltage is then scaled to become a 1 V output on A27. External CAL signals are also scaled 5:1 in A27.

Power Input

All power for the main circuit board comes from the power supply board to connector J4.

Panel Meters

The V_1 meter displays either V_1 from the ME1 section or $V_1 - V_2$ from the output of A30.

The V_2 meter is switched off by the second pole of the In Use/Standby switch.

The current meter displays either I_1 or I_2 . The decimal point is set by a link in the headstage corresponding to the headstage current gain (H). Pin 2 of the panel meter is the decimal point common. Pins A, 1, and 3 select the various decimal points.

Differential Amplifier

The difference of $10V_1$ and $10V_2$ is found in amplifier A30.

Bath Amplifier

An HS-2 headstage can be plugged into connector J3. The voltage recorded by this headstage or by an external amplifier is buffered by A28.

Audio Monitor

The Audio Monitor puts out a tone whose pitch is proportional to V_1 or V_2 . When the selector switch is in the OFF position a negative input is applied to the voltage controlled oscillator U7 to switch it off. The pitch is tuned by RVT24. An earphone can be plugged into the Phone jack on the front panel. This disables the speaker drive.

Filters

Two second-order lowpass filters (assembly A1005) are located on the front panel. The input to each filter is selected by a rotary switch. The filter output can be bypassed.

Reference

A stable reference is generated in A35. This is inverted in A29 so that a bipolar reference is available.

STEP COMMAND GENERATOR - ASSEMBLY A1004

The setting of the thumbwheel switch establishes the current output of the multiplying digital-to-analog convertor A1. A2 converts the current output into a voltage output. The polarity and maximum output depends on the polarity and amplitude of the reference voltage connected to V_{in} of A1.

SECOND ORDER LOWPASS FILTER - ASSEMBLY A1005

This filter is a lowpass Sallen and Key filter. The filter is a multiple coincident pole type which has zero overshoot (damping ratio = 1). The twelve-position rotary switch rotates without stops.

ADJUSTMENT PROCEDURE

FOR SERIAL # 0126 AND ABOVE

Abbreviations

CMRR; common-mode rejection ratio

TP; test point

V_{pp}; volts peak-to-peak

gnd; ground

HCG; headstage current gain

scope; cathode ray oscilloscope

DVM; digital volt meter

DPM; digital panel meter

Equipment required

Differential-input scope with 50 uV/div resolution

DVM

Square-wave generator

Trim procedure

It is important to do the trims in the order presented because some of them rely on earlier trims. For brevity, only changes to the previous setup are listed for each trim.

Measurement techniques

Measuring 0 V. You will be asked to trim for 0 V differentially, e.g. across TP7 - TP8. First connect both probes from the scope to the ground point (the second mentioned test point, in this example TP8) to establish 0 V. Next connect the probes separately to the two test points and make the requested trim. See fig. 1 for details of how to ground the oscilloscope correctly.

Filtering. When measuring zero volts or establishing a null the input to the scope should be lowpass filtered at 10 kHz or less.

Measuring DC voltages. To eliminate offset errors from the measurement all of these measurements will be balanced. That is, the command potential will be switched alternately from +ve to -ve and the difference in the measured outputs will be measured. Connect DVM ground to yellow ground plug at rear of unit.

HCG. Some measurements require a x1 headstage and a 10 M 1% resistor. If you do not have a x1 headstage a x0.1 headstage can be used with a 100 M 1% resistor.

1. Reference Voltage accuracy

Using DVM monitor TP19(VT)

Thumbwheel on 100.0 continuous

Repetitively switch from +100.0 to -100.0

[] Trim RVT21 for 10.00V difference

2. Thumbwheel-to-Voltage Convertor offset

Thumbwheel on 000.0

On scope measure TP19(VT) - TP10(gnd) at 100 μ V/div

Repetitively switch from CONT. to EXT.

[] Adjust trim pot on back of thumbwheel for a null

3. CCS1 CMRR

Switch off all current commands

Plug x1 headstage into ME1 connector

Connect a 1 Vpp 100 Hz square wave directly to the headstage input

On scope measure TP8(Vo1) - source voltage at 100 μ V/div

[] Trim RVT18 for a null

4. I1 CMRR

On scope measure TP11(I1) - TP10(gnd) at 100 μ V/div

[] Trim RVT20 for a null

5. ME1 Command accuracy

Remove headstage

Link pins 8(gnd) and 11(V1A) with a 22 ohm resistor

Using DVM monitor TP8(Vo1)

Thumbwheel on 100.0 continuous

Destination ME1

Repetitively switch from +100.0 to -100.0

[] Trim RVT17 for 2.000 V difference

6. I DPM accuracy

Display current I1

Repetitively switch from +100.0 to -100.0

[] Adjust trim pot inside I1 DPM to read ± 100.0

7. ME1 Pulse offset

Thumbwheel off

On scope measure TP8(Vo1) - TP10(gnd) at 100 μ V/div

Pulse potentiometer on zero

Establish level on scope for Pulse switch in OFF position

Set switch to CONT. position

Repetitively switch from + to -

[] Trim RVT16 for balanced shift about established level

8. CCS1 offset

Switch Pulse Command off

[] Trim RVT19 for OV

9. I1 offset

Set Resistance Compensation potentiometer to zero, Normal position

On scope measure TP12(10V1) at 2mV/div

Use offset control to center trace on screen

[] Trim RVT13 so that trace does not shift as Resistance Compensation increased to maximum.

10. Headstage offset

Set Resistance Compensation potentiometer to zero

Plug headstage into ME1 slot

Ground via resistor of 10 M \div H

Wait 5 min after plugging in headstage

[] Adjust trim pot inside headstage until there is no shift when the grounding resistor is shorted out

[] Repeat for other headstages

11. 10V1 accuracy

Plug in x1 headstage

Ground via 10 MΩ

Set Resistance Compensation to indicate 0 MΩ

Using DVM monitor TP16(F1)

On F1 select Ve1

Repetitively switch thumbwheel from +100.0 to -100.0

Make a note of the total voltage change

On F1 select 10V1

[] Trim RVT15 so change in 10V1 is ten times change in Ve1

12. V1 DPM accuracy

On F1 select Ve1

Continue repetitive switching

[] Adjust trim pot inside V1 DPM to read same total change as DVM

13. ME1 Resistance Compensation accuracy

On scope measure TP12(10V1) at 20mV/div

Ground via 10 M, 1% or better

Set Resistance Compensation to indicate 10 M

Thumbwheel on 100.0

Externally activate at 100 Hz

[] Trim RVT14 for a null

14. CCS2 CMRR

Switch off all current commands

Plug x1 headstage into ME2 connector

Connect a 1 Vpp 100 Hz square wave directly to the headstage input

On scope measure TP2(Vo2) - source voltage at 100µV/div

[] Trim RVT8 for a null

15. I2 CMRR

On scope measure TP5(I2) - TP4(gnd) at 100 μ V/div

[] Trim RVT10 for a null

16. ME2 Command accuracy

Remove headstage

Link pins 8(gnd) and 11(V1A) with a 22 ohm resistor

Using DVM monitor TP2(Vo2)

Thumbwheel on 100.0 continuous

Destination ME2

Repetitively switch from +100.0 to -100.0

[] Trim RVT7 for 2.000 V difference

17. ME2 Pulse offset

Thumbwheel off

On scope measure TP2(Vo2) - TP4(gnd) at 100 μ V/div

Pulse potentiometer on zero

Establish level on scope for Pulse switch in OFF position

Set switch to CONT. position

Repetitively switch from + to -

[] Trim RVT6 for balanced shift about established level

18. CCS2 offset

Switch Pulse Command off

[] Trim RVT9 for OV

19. I2 offset

Set Resistance Compensation potentiometer to zero, Normal position

On scope measure TP6(10V2) at 2mV/div

Use offset control to center trace on screen

[] Trim RVT3 so that trace does not shift as Resistance Compensation increased to maximum.

20. 10V2 accuracy

Plug in x1 headstage

Ground via 10 MΩ

Set Resistance Compensation to indicate 0 MΩ

Using DVM monitor TP17(F2)

On F2 select Ve2

Repetitively switch from +100.0 to -100.0

Make a note of the total voltage change

On F2 select 10V2

[] Trim RVT5 so change in 10V2 is ten times change in Ve2

21. V2 DPM accuracy

On F2 select Ve2

Continue repetitive switching

[] Adjust trim pot inside V2 DPM to read same total change as DVM

22. ME2 Resistance Compensation accuracy

On scope measure TP6(10V2) at 20mV/div

Ground via 10 M, 1% or better

Set Resistance Compensation to indicate 10 MΩ

Thumbwheel on 100.0

Externally activate at 100 Hz

[] Trim RVT4 for a null

23. 100V2 offset

Switch off external activation

Remove headstage

On scope measure TP3(100V2) - TP4(gnd) at 10mV/div

[] Trim RVT1 for OV

24. V1-V2 accuracy

Plug in two headstages

Connect a 1 Vpp 100 Hz square wave directly to both headstage inputs

On scope measure TP20(V1-V2) - TP4(gnd) at 10mV/div

[] Trim RVT23 for a null

25. CAL accuracy

Switch off external activation

Using DVM monitor TP18(CAL)

Repetitively activate CAL switch

[] Trim RVT22 for -1.000 V shift

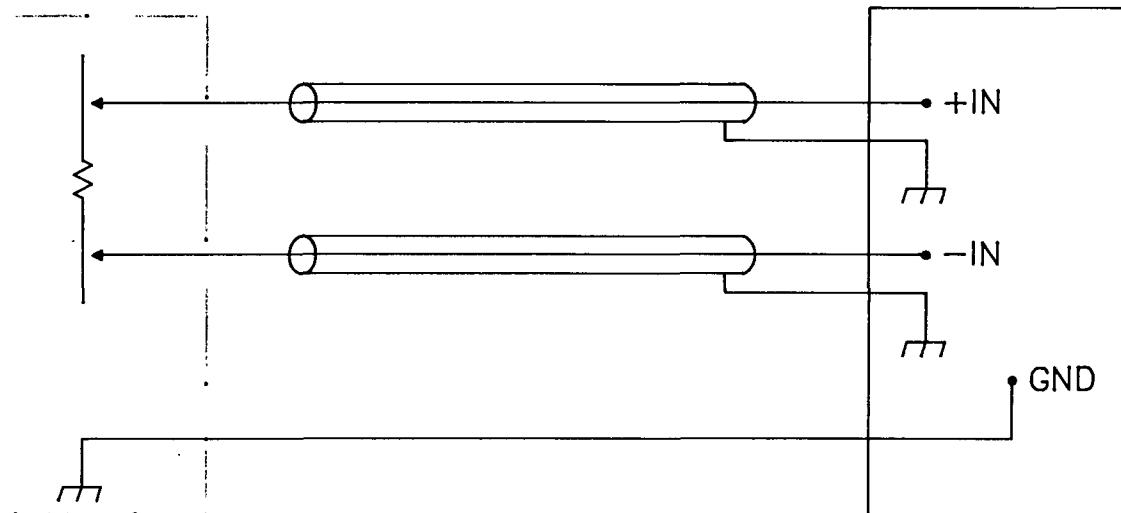

26. Audio Monitor frequency

Connect scope or frequency meter to TP23(VCO)

Select V1 as Audio Monitor input

Set V1 Offset to 0 V

[] Trim RVT24 for 2.25 kHz (450 us period)

Equipment
under test

Oscilloscope

FIG. 1 - DIFFERENTIAL MEASUREMENTS ON OSCILLOSCOPE

Correct technique for connecting an oscilloscope to make
differential measurements in low and medium frequencies.

MAINTENANCE

Adjustment and repair should only be attempted by skilled electronic technicians or engineers.

Caution

Line voltage is connected to some of the transformer leads and some parts of the power-supply board in the left hand side of the instrument. Always unplug the power cord before attempting to handle or repair these sections.

Access

All test points and trim potentiometers can be accessed by removing the top cover.

All components can be desoldered from the main circuit board without removing the board. Simply remove the bottom cover for access to the non-component side of the board. We anticipate no reason to remove the main circuit board.

Routine Maintenance

Routine maintenance is not required. The adjustment procedure should be performed after repairs to the main circuit board but not otherwise.

As required, the operator of the instrument can perform the headstage leakage current adjustment described in the operator's manual.

DRAWING CONVENTIONS

Signal Identification

→ CAL (ME2) refers to a signal called CAL going to the ME2 section of the circuit.

CAL → (COMMON) refers to a signal called CAL coming from the COMMON section of the circuit.

Signal Naming

The same name may be used for related devices, signals and time periods. Logic signals are named to correspond to positive logic. A bar over the name indicates the logic complement. Signal names in square boxes appear on the front and rear panels.

Component Values

Electrical components shown on the diagrams are in the following units unless noted otherwise.

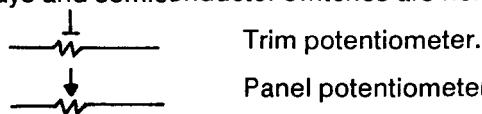

Capacitors: Values one or greater are in picofarads (pF)
Values less than one are in microfarads (uF)

Resistors: Ohms

Special Symbols

Jx-y SIGNAL  Indicates SIGNAL leaves circuit board at connector number x, pin y.

Relays and semiconductor switches are normally shown unenergized.

Reserved Wire Colors

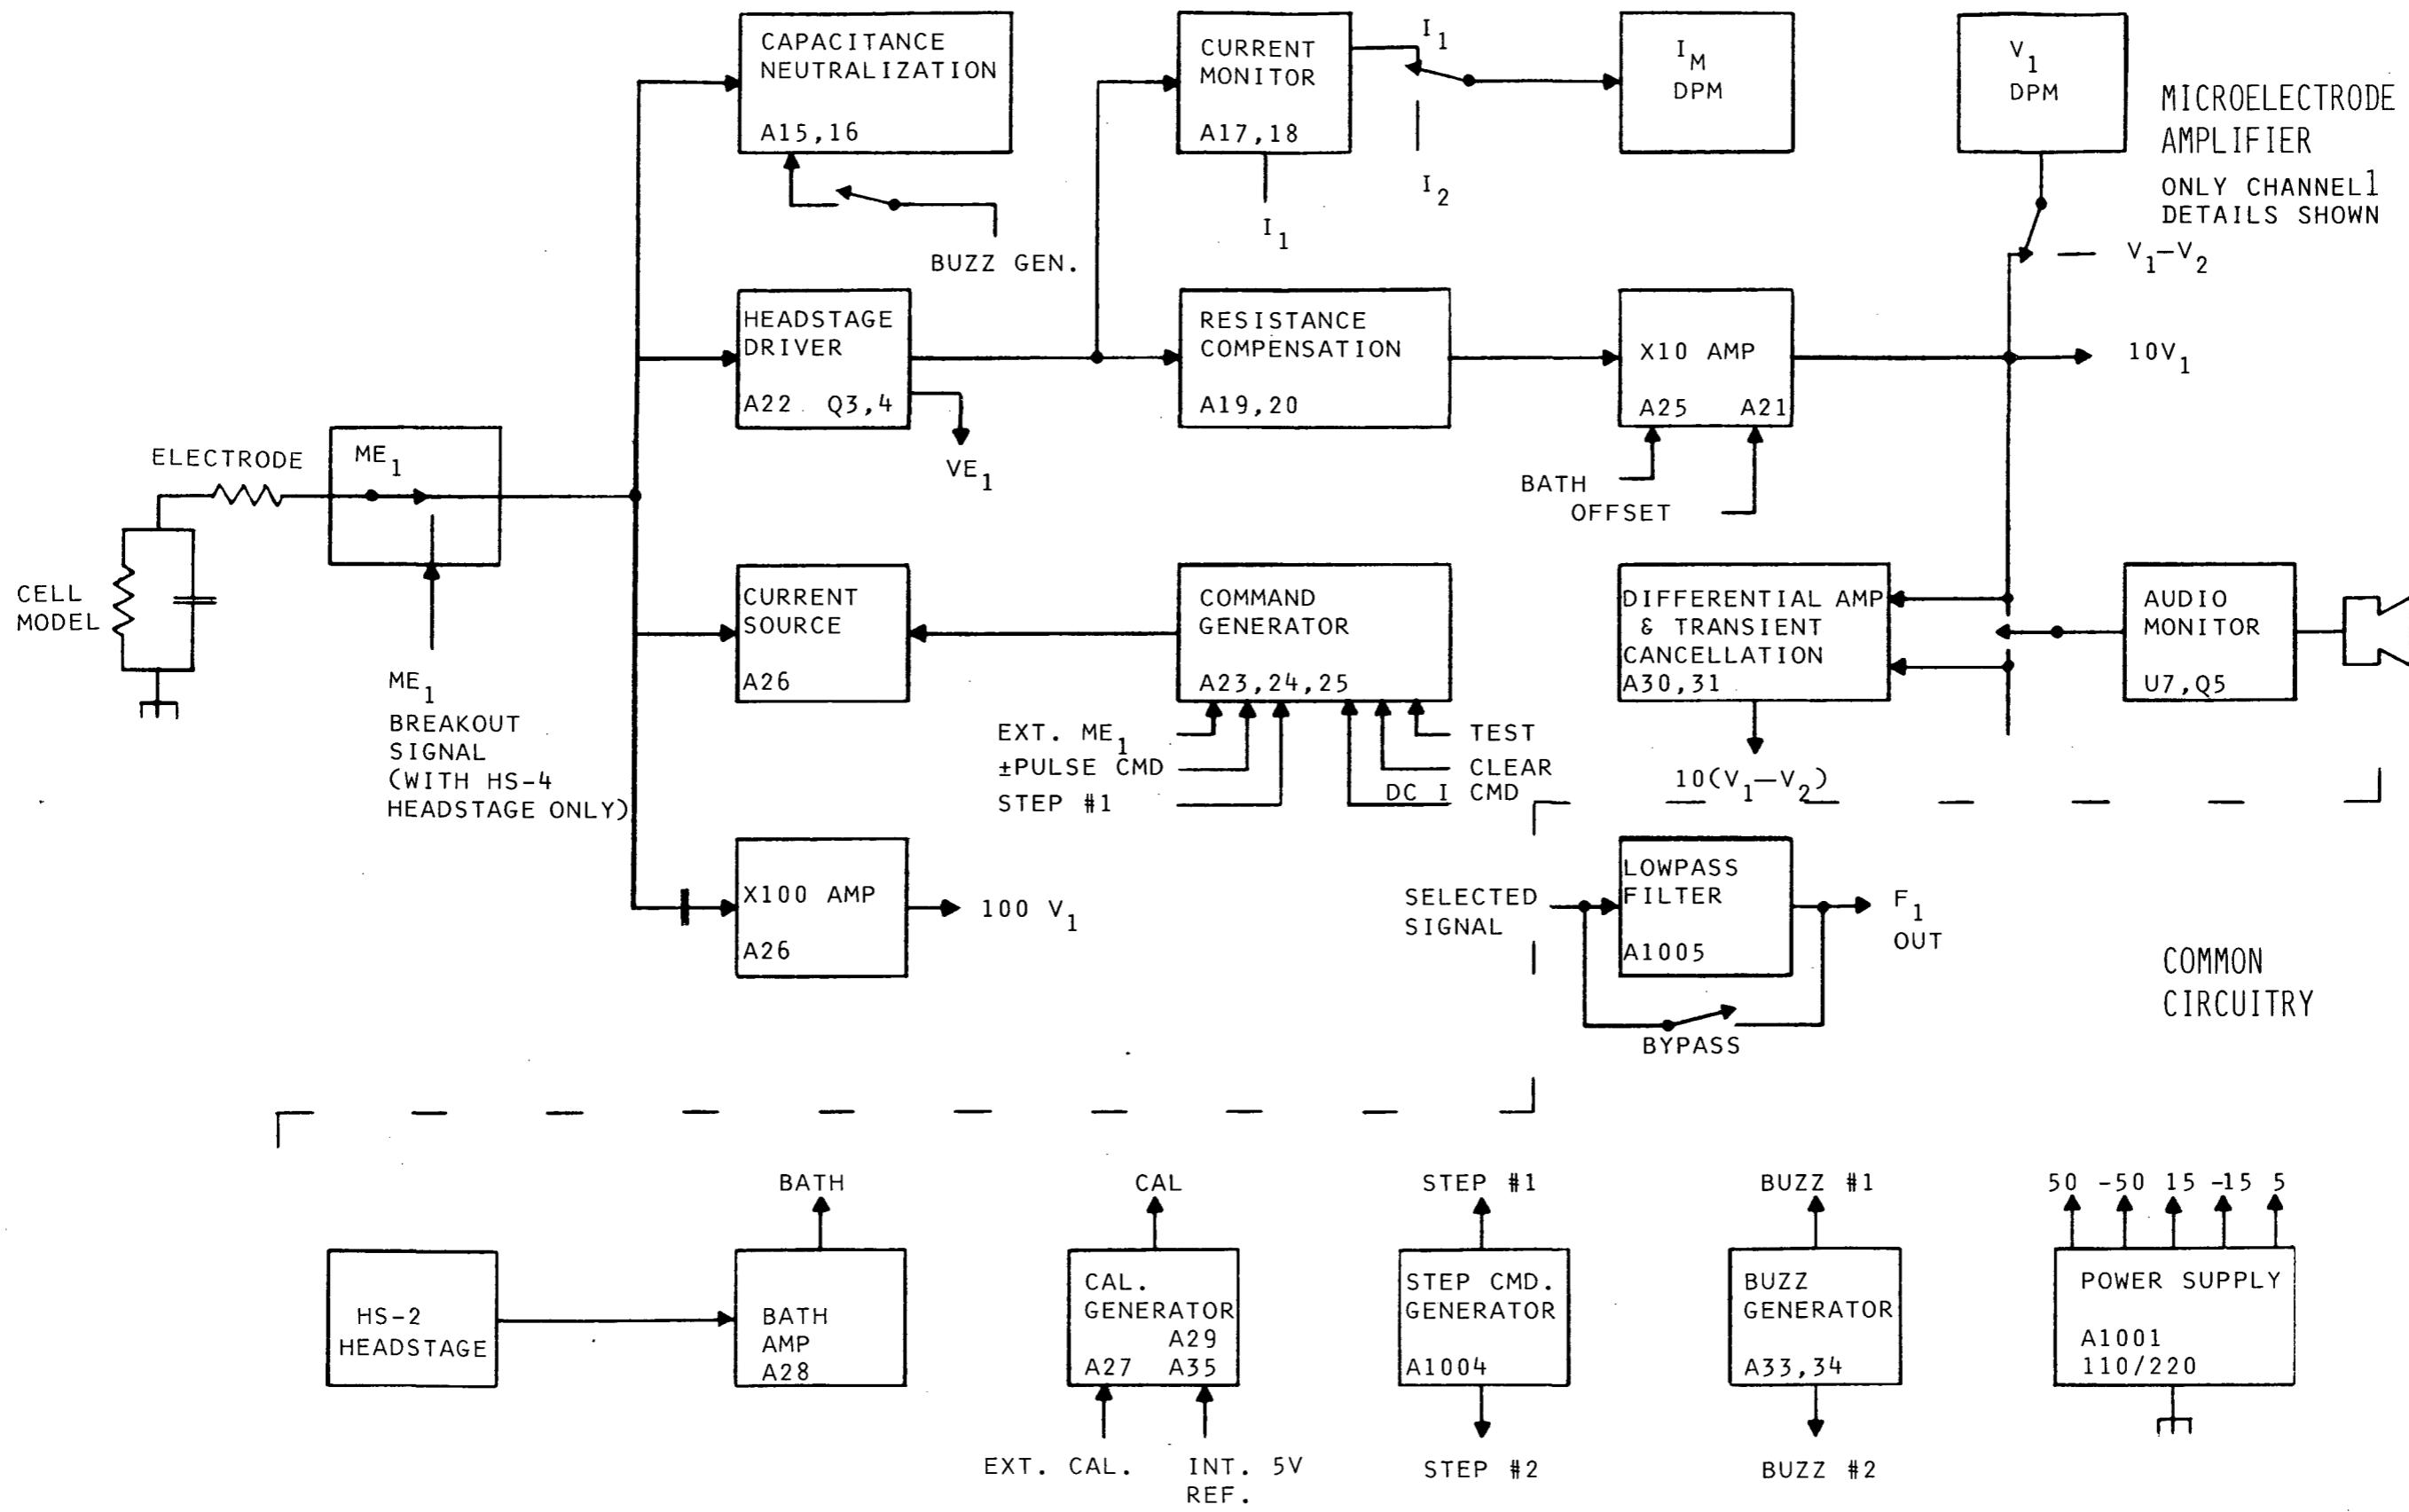

Orange: +5 V

Red: +15 V

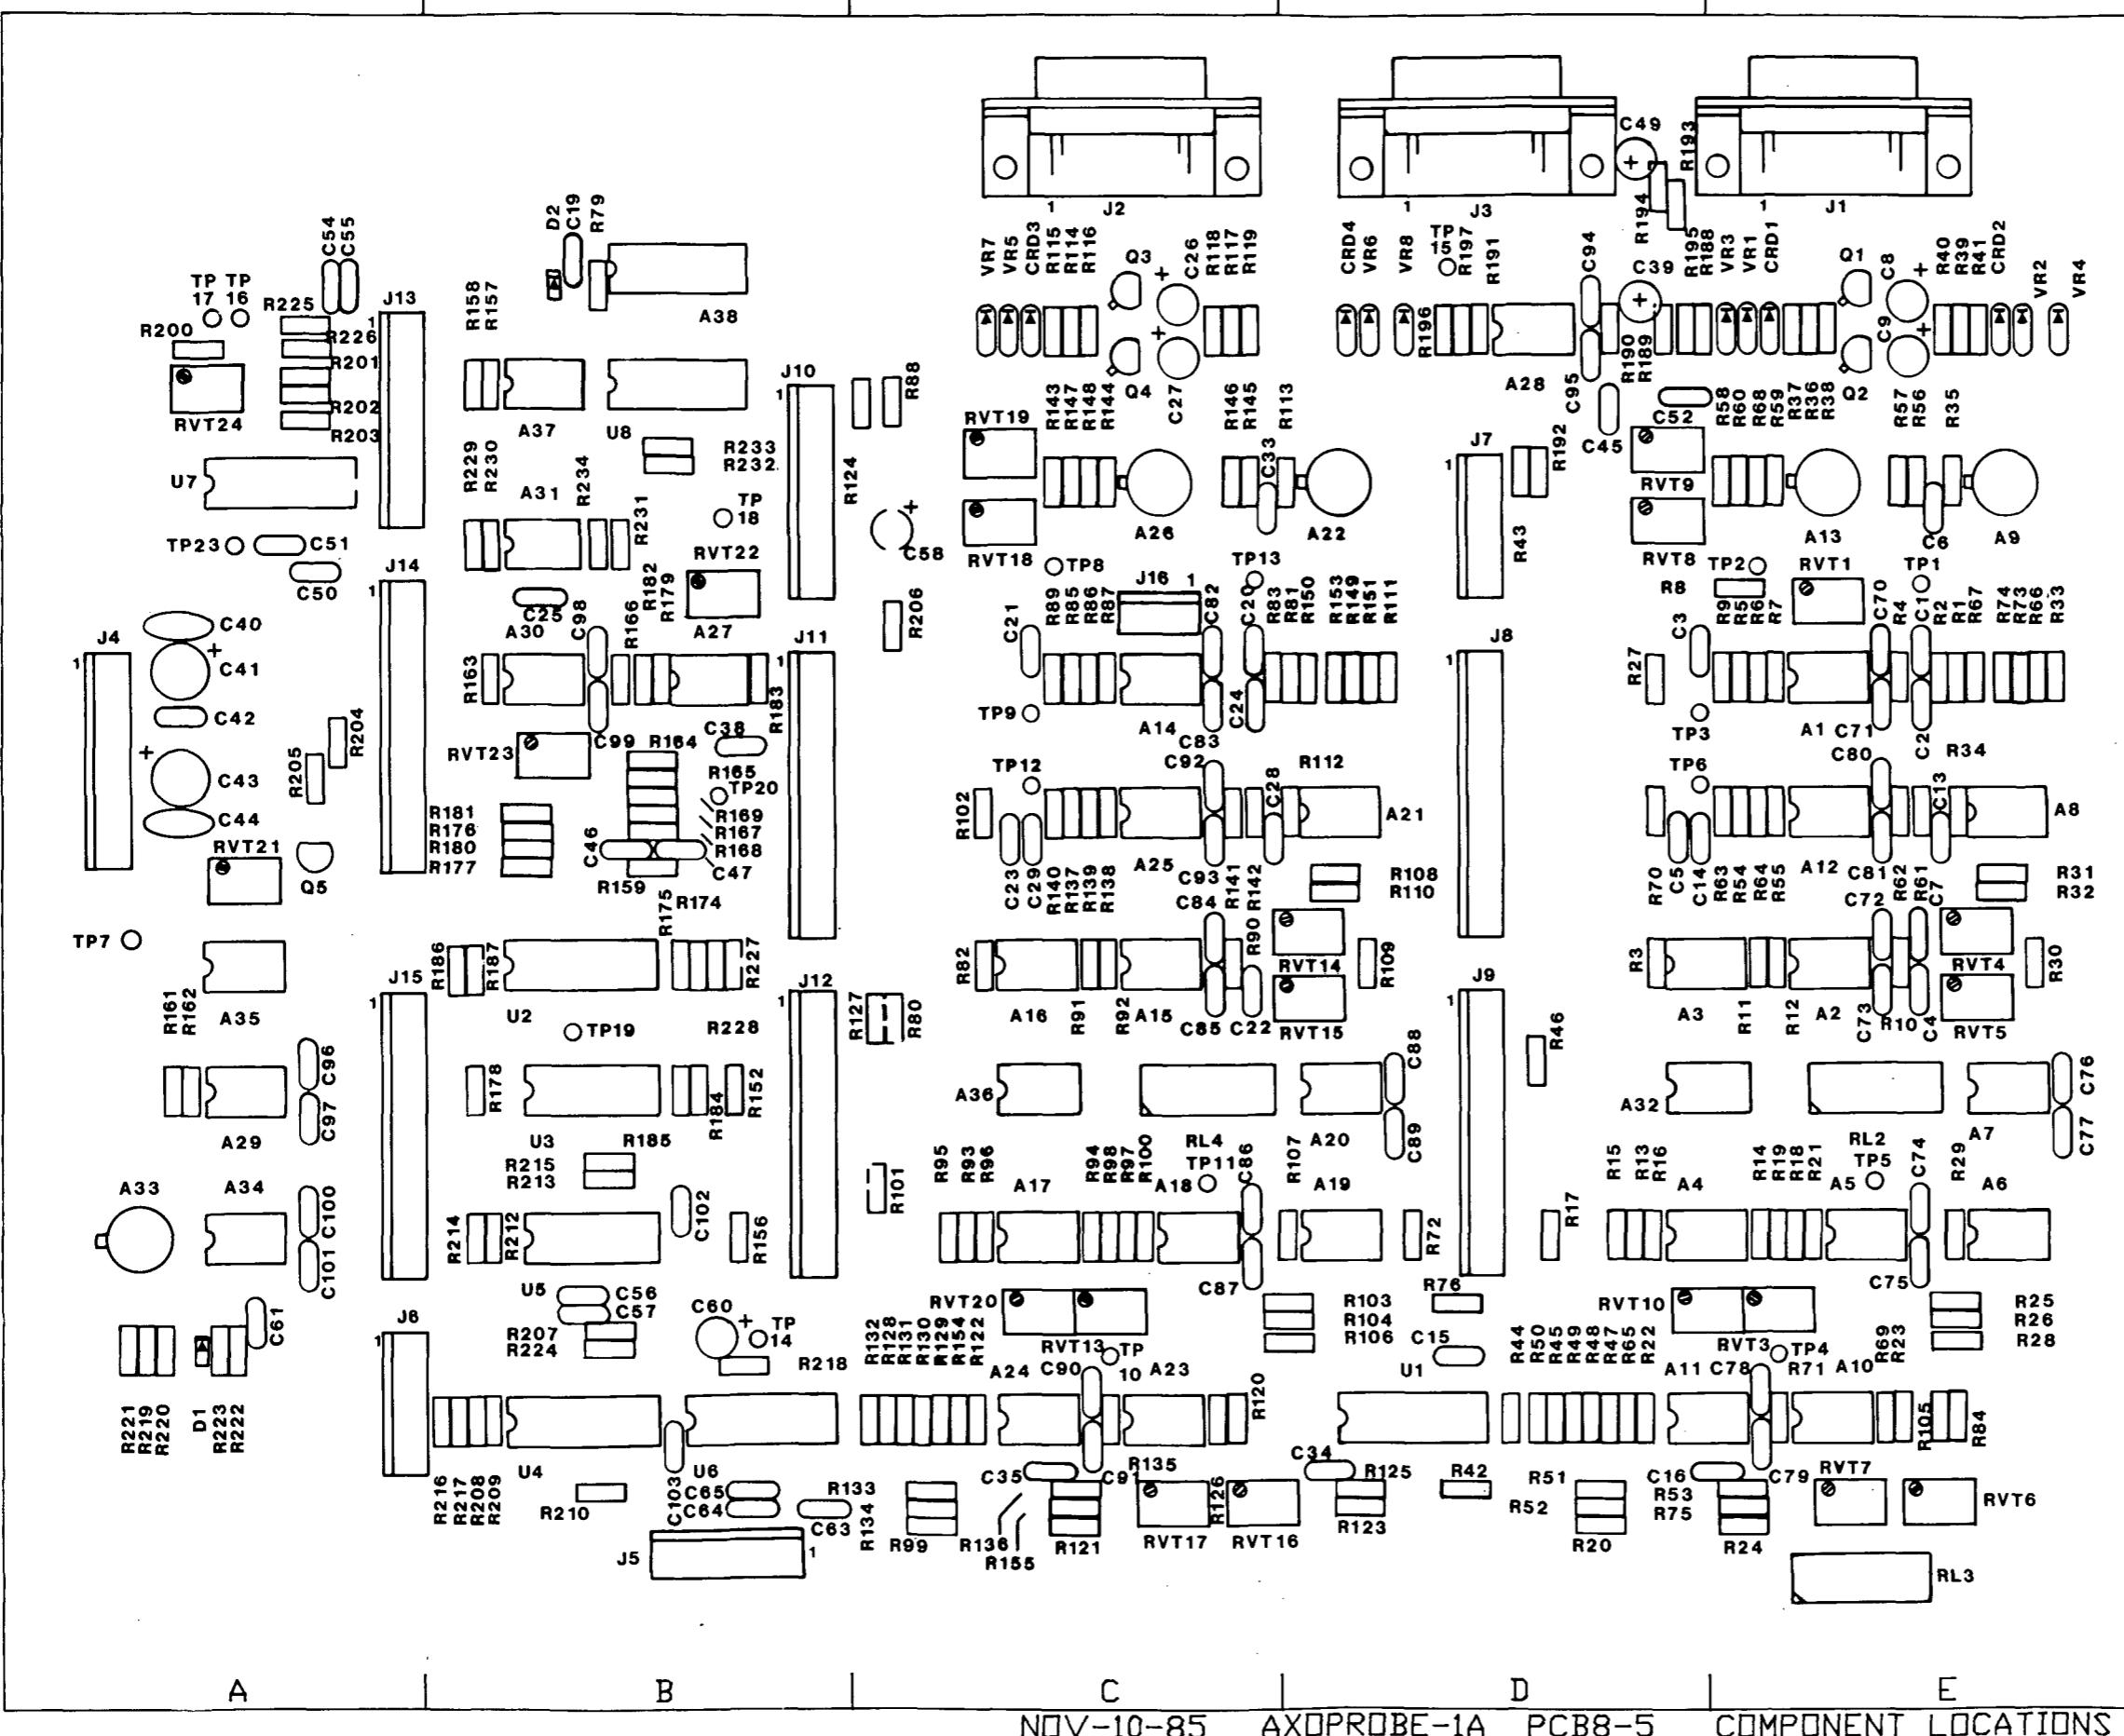

Yellow: Signal ground

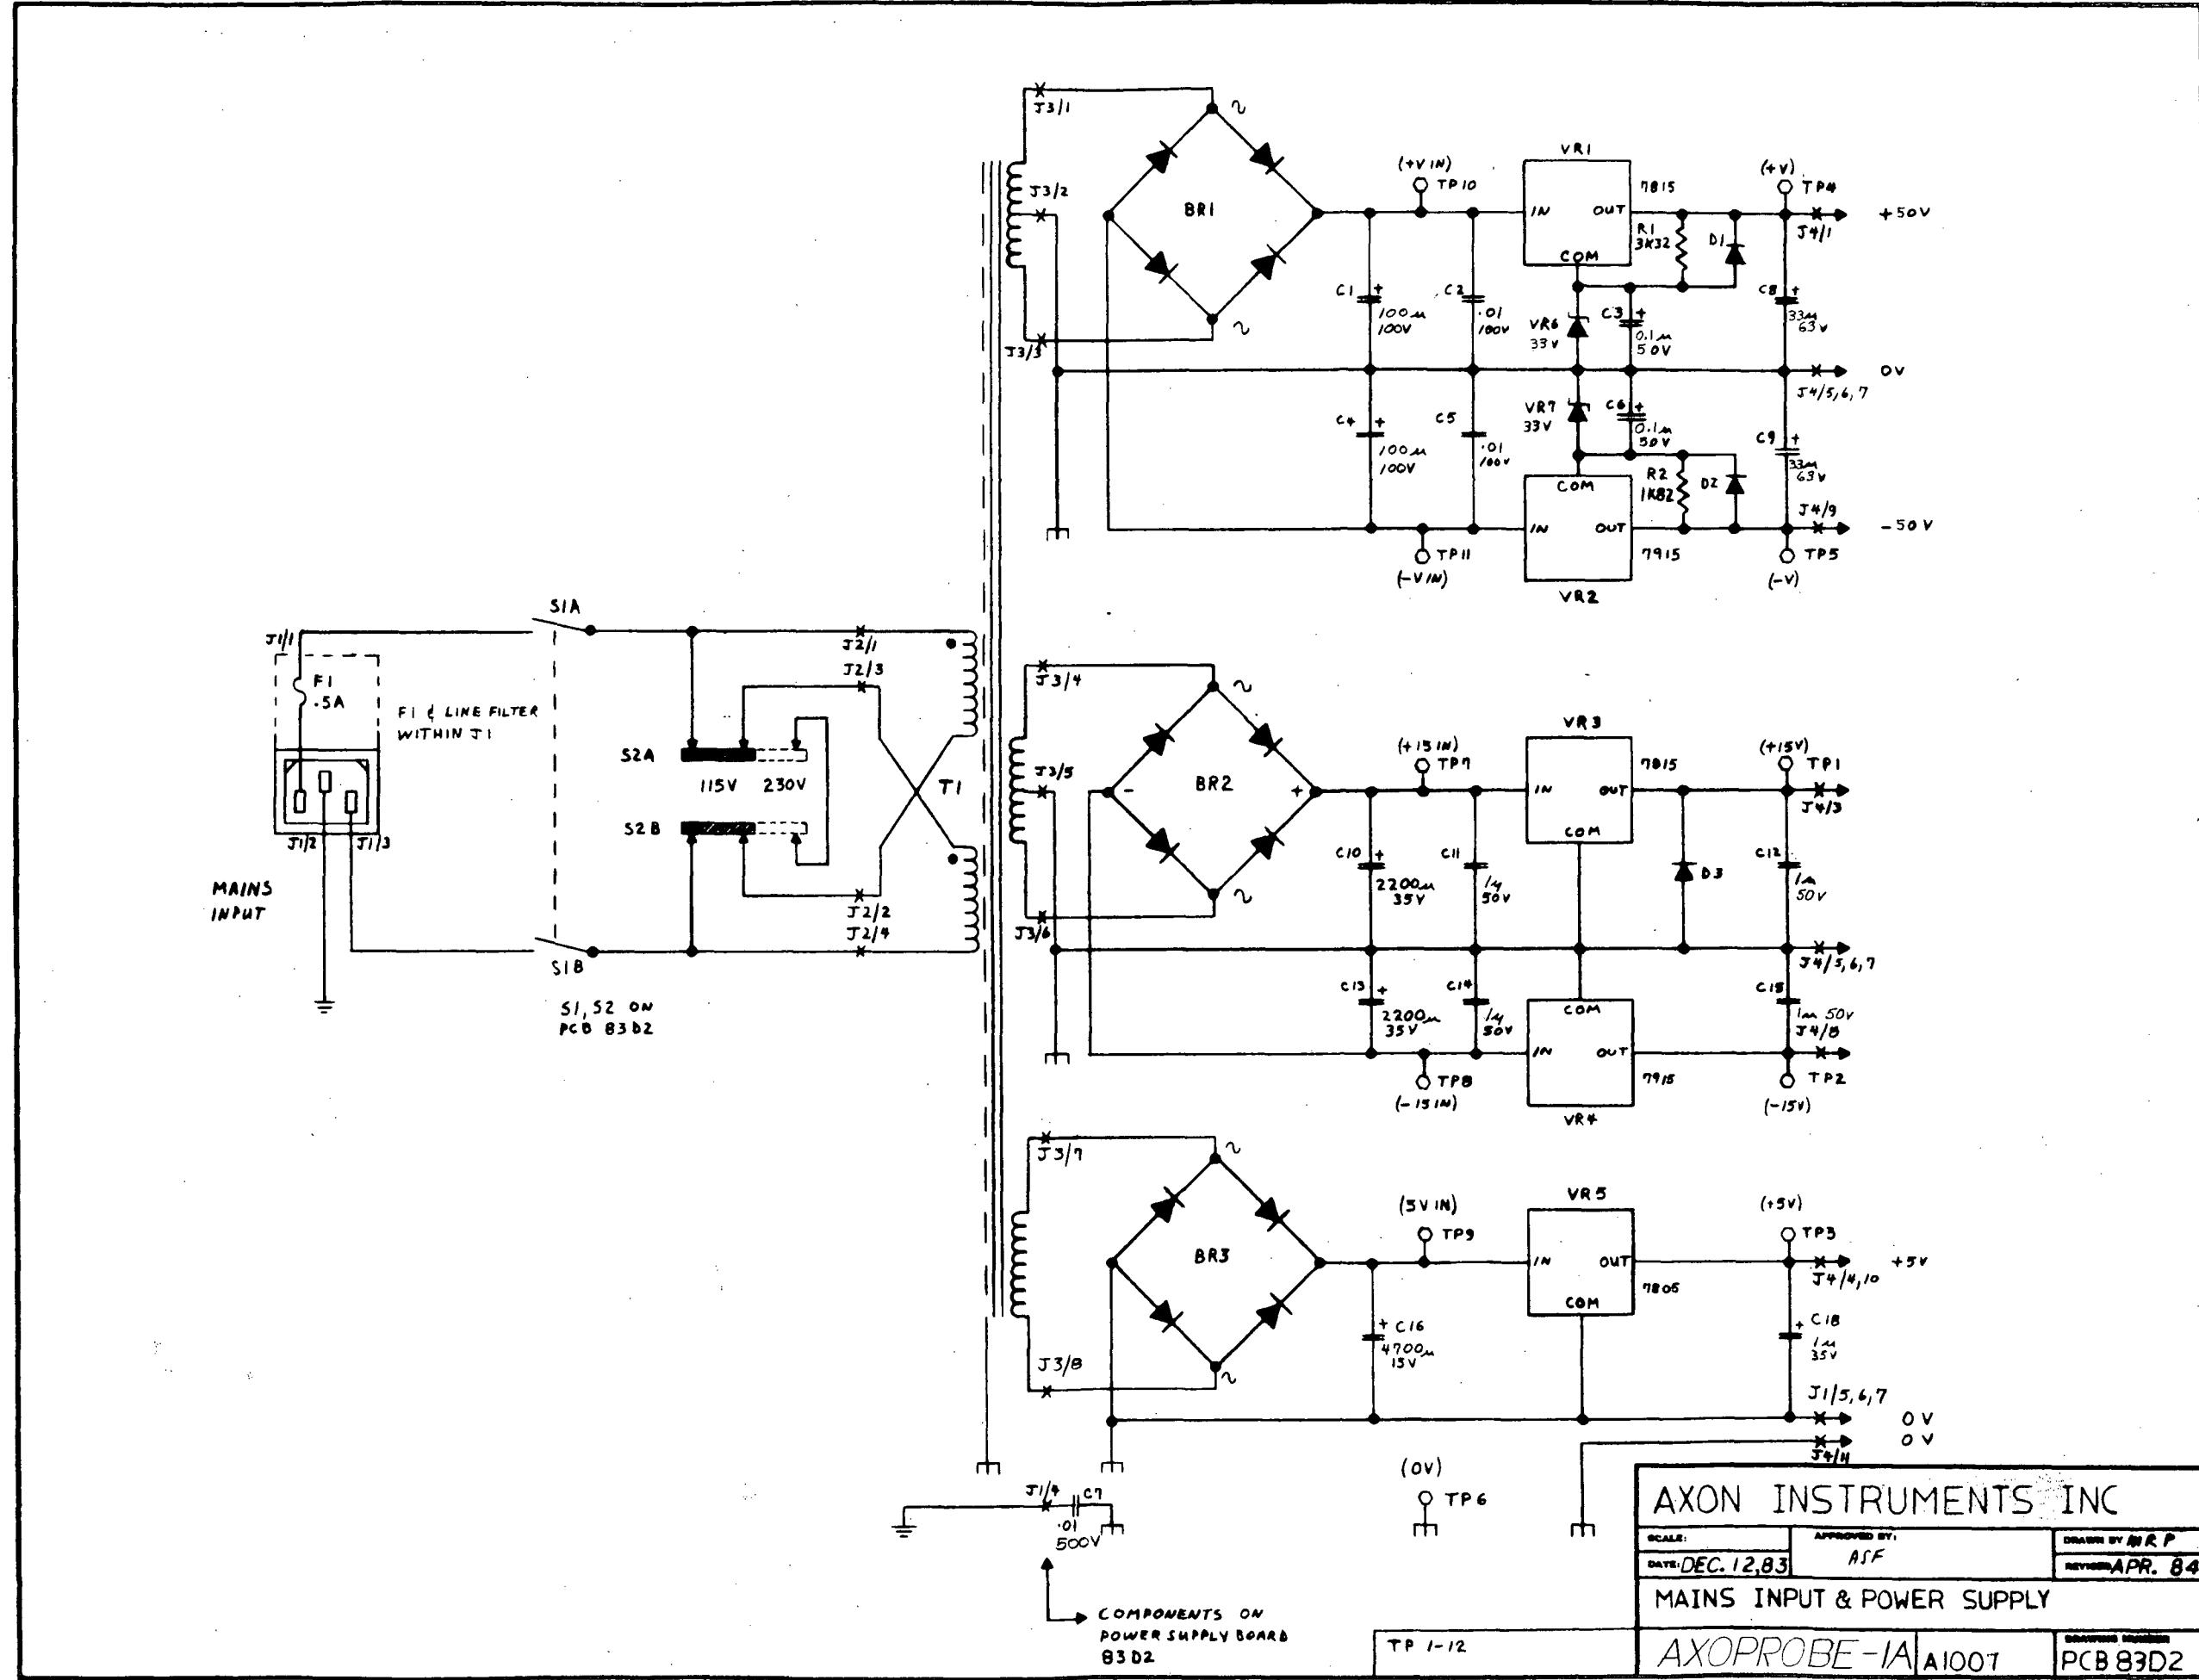

Blue: -15 V

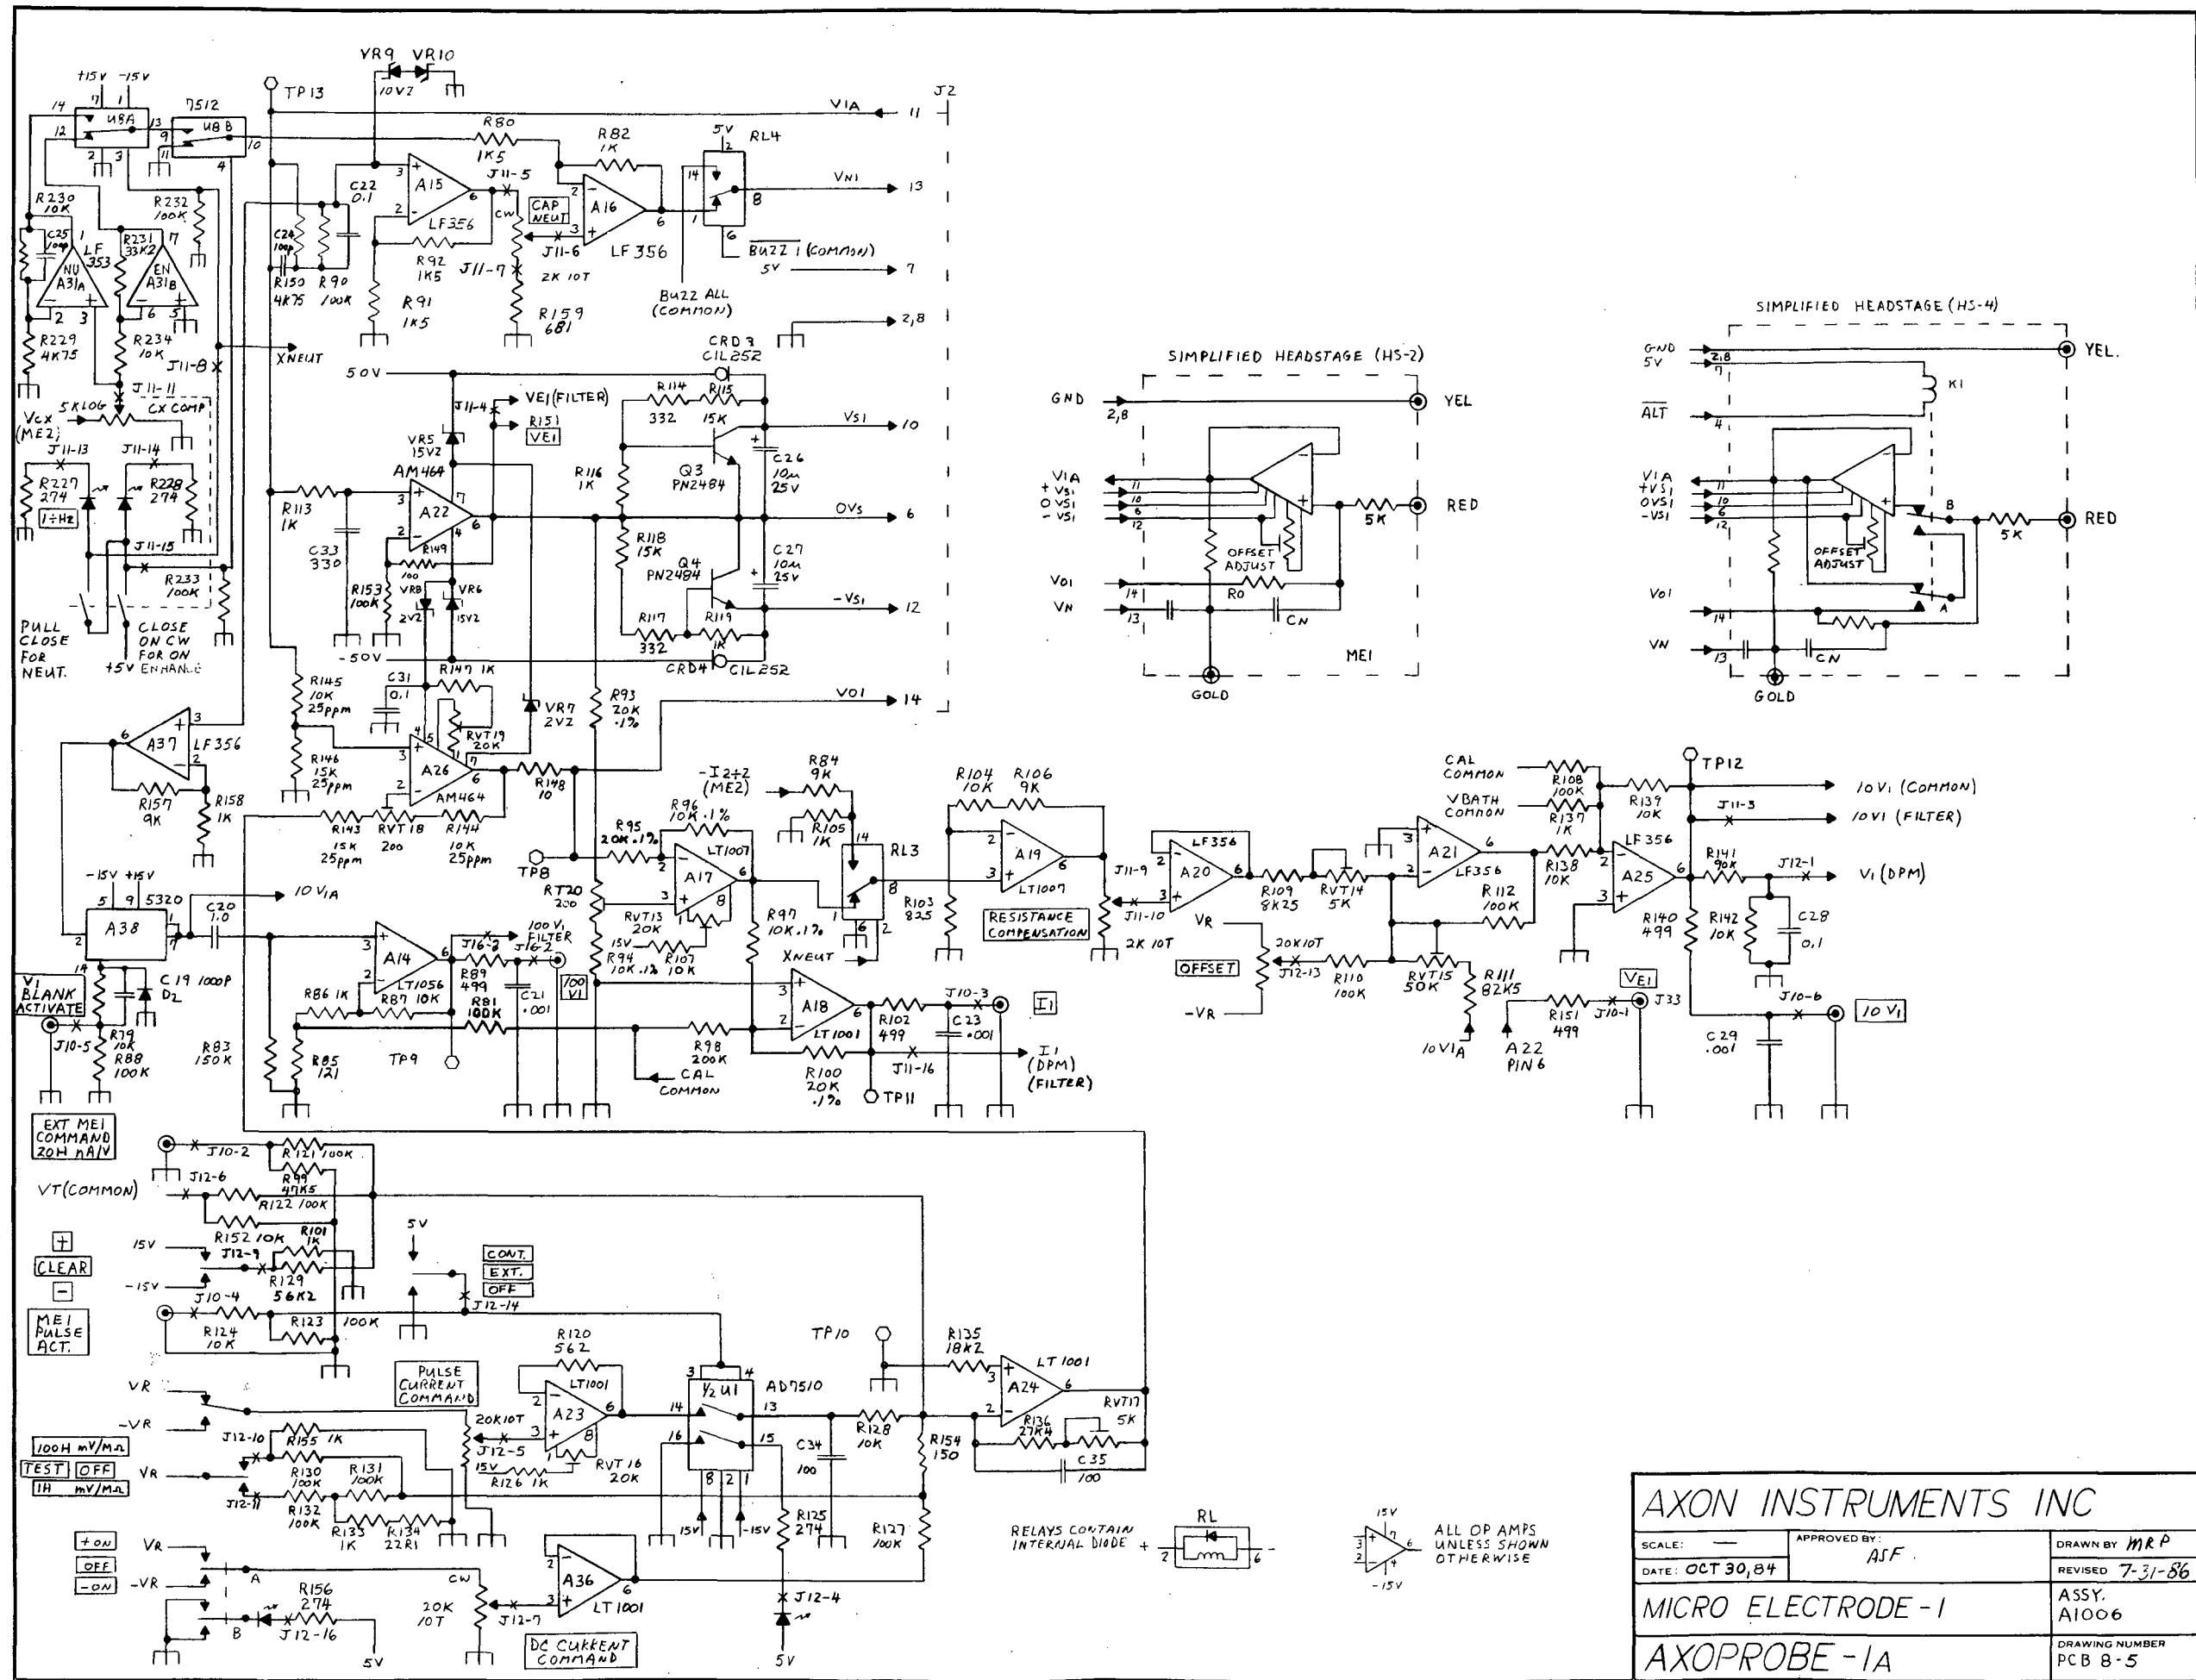

Green: Digital ground

CHANGES TO THE SERVICE MANUAL

To Keep abreast of newly developed electronic components, technologies and user comments, Axon Instruments continually tries to improve its products.

Because shipping and manual printing schedules sometimes conflict, your manual may not contain the most up-to-date information. The following pages contain change information, unless your manual is correct as printed.

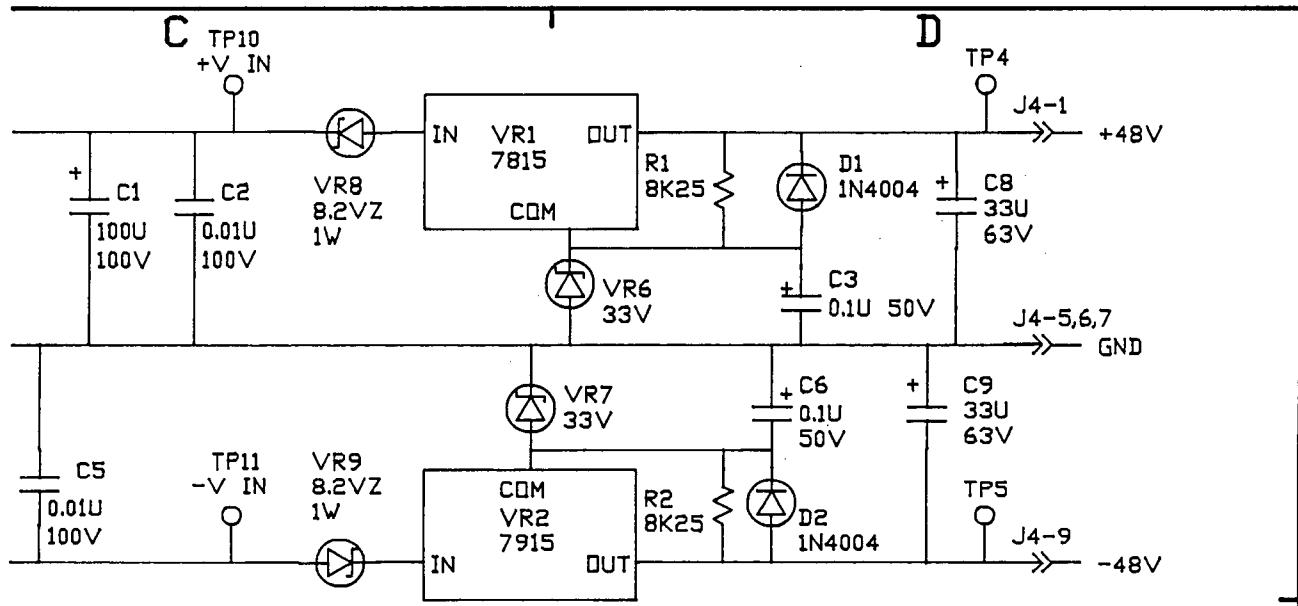

ERRATA AXOPROBE-1A

Please note the following changes to the powersupply.

Schematic 3430-005.SCH:

Add 8.2V Zeners VR8, VR9
 Changed R1, R2 to 8K25

APN 4030-005
 APN 3500-219

AXON INSTRUMENTS, INC.

Fax 344-4282, MCI Mail 275-2095

November 1987

Dear AXOPROBE Owner:

The AXOPROBE now has a new accessory: the CLAMP-1 model cell.

This model cell plugs directly into the input sockets of the headstages. A switch allows the CLAMP-1 model cell to be configured as (a) BATH mode – two $50\text{ M}\Omega$ electrodes to ground, or (b) CELL mode – two electrodes connected to a $50\text{ M}\Omega // 500\text{ pF}$ cell.

The CLAMP-1 model cell can be used to test and practice using the AXOPROBE. Techniques such as bridge balancing and capacitance compensation can be easily rehearsed. The CLAMP-1 model cell is a useful tool to use while learning the operation of the AXOPROBE and subsequently to verify the correct operation of the AXOPROBE and the recording pathway.

This model cell is being supplied as a standard accessory with new AXOPROBE-1As. It is also being supplied at no charge to owners of AXOPROBE-1As that shipped after July 1st, 1987. If you fall into this category, this letter will be accompanied by a CLAMP-1 model cell.

For earlier users, we are making the CLAMP-1 model cell available for a minimal cost of \$130.

You may order the model cell by phone or in writing. In either case, we will need an official purchase order number. The CLAMP-1 model cell is available for delivery 2 weeks after receipt of an order.

We hope you will find that this model cell is a useful tool to assist you in using your AXOPROBE.

Yours sincerely,

Alan Finkel, Ph.D.
President

INSTRUCTIONS / INFORMATION

CLAMP-1 MODEL CELL

If you do not need to model your cell exactly, the CLAMP-1 Model Cell is a convenient model to work with. The cell and electrode components simulate a small-to-medium sized cell having an input resistance of $50\text{ M}\Omega$, a membrane time constant of 25 ms and electrode resistances of $50\text{ M}\Omega$. See the figure below. The case of the model cell is connected to ground. Shielding between the two electrode resistors is effected by the body of the switch.

Install the model cell by plugging it into one or both of your headstages. Connect the gold-plated ground jack to the **yellow** jack on the back of the ME1 headstage using the cable provided. Do not make any connection to the gold-plated jack on the front of the HS-2 headstage -- this is connected to the headstage case which is driven to the electrode potential.

When the switch is in the BATH position, both electrode resistors are connected to ground. This is a convenient position for practicing bridge balancing techniques and offset adjustment.

When the switch is in the CELL position, both electrode resistors are effectively intracellular. In Bridge or DCC mode you should see exponential voltage responses to steps of current. In dSEVC mode you should be able to clamp the cell at gains of up to 0.8 nA/mV using an HS-2 x0.1 headstage, at sampling rates up to 8 kHz. In TEVC mode, use one of the following electrode combinations: 1) two x0.1 headstages, two x1 headstages, or a x1 headstage for ME2 and a x0.1 headstage for ME1. The electrode resistances in this model cell are too large for you to practice cSEVC.
