

Quiz 1 – Electrostatics (17 Jan 2007)

The force on charge q_1 from charge q_2 is $\vec{F}_{12} = k_e \frac{q_1 q_2}{r_{12}^2} \hat{r}_{12}$, where the direction vector \hat{r}_{12} points from q_2 to q_1 and the proportionality constant is $k_e = 8.99 \times 10^9 \text{ Nm}^2/\text{C}^2$.

Note that the permittivity of free space is $\epsilon_0 \equiv \frac{1}{4\pi k_e} = 8.85 \times 10^{-12} \text{ C}^2/(\text{Nm}^2)$.

Note that the unit of elemental electronic charge is $e^- = -1.62 \times 10^{-19} \text{ C}$.

We note the Taylor's expansion $(1+x)^n = 1 + nx + \dots$, which is useful when $nx \ll 1$. For example,

$$\frac{1}{(r+d)^2} = \frac{1}{r^2} \left(1 + \frac{d}{r}\right)^{-2} = \frac{1}{r^2} \left(1 - 2\frac{d}{r} + \dots\right) \approx \frac{1}{r^2} - 2\frac{d}{r^3} \text{ for } d \ll r.$$

The force on a test charge q_0 induced by an electric field, denoted \vec{E} , is $\vec{F} = q_0 \vec{E}$.

1. Two positive charges of strength $Q_1 = +1.0 \times 10^{-3} \text{ Coulombs}$ sit along the x-axis as shown in figure 1 ($+\hat{x}$ points to the right along x & $+\hat{y}$ points to the up along y), with $L = 20 \text{ cm}$. What is the x-direction of the force on a negative charge of strength $Q_2 = -1.0 \times 10^{-6} \text{ Coulombs}$ that sits at $(x, y) = (L, L)$?

Figure 1

- A) $-3.0 \times 10^2 \text{ N } \hat{x}$
- B) $-2.3 \times 10^3 \text{ N } \hat{x}$
- C) $-7.9 \times 10^1 \text{ N } \hat{x}$
- D) $+3.0 \times 10^2 \text{ N } \hat{x}$
- E) $+7.9 \times 10^1 \text{ N } \hat{x}$

2. With reference again to figure 1, and Q_1 , Q_2 , and L defined as above, what is the y-direction of the force on Q_2 ?

- A) $-3.0 \times 10^2 \text{ N } \hat{y}$
- B) $-2.3 \times 10^2 \text{ N } \hat{y}$
- C) $-7.9 \times 10^1 \text{ N } \hat{y}$
- D) $-6.1 \times 10^1 \text{ N } \hat{y}$
- E) $-3.0 \times 10^0 \text{ N } \hat{y}$

3. Two charged balls with identical mass, M , form a double pendulum as shown in figure 2. The charge on one ball is $Q_1 = +1.0 \times 10^{-6} \text{ C}$ and the other is $Q_2 = +3.0 \times 10^{-6} \text{ C}$. The strings have the same length, with $L = 20 \text{ cm}$ and the angle formed by the two balls is $2\theta = 60^\circ$ ($\theta = 30^\circ$). What is the mass?

- A) $3.0 \times 10^{-2} \text{ kg}$
- B) $1.2 \times 10^{-1} \text{ kg}$
- C) $4.8 \times 10^{-1} \text{ kg}$
- D) 1.2 kg
- E) This system is unstable as the two values of the charge are different.

4. Four charges, two positive with strength $+|e|$ and two negative with strength $-|e|$, are *symmetrically* configured along the x -axis as shown in figure 3. What is the force on the test charge q_0 ?

- A) $k_e \frac{q_0 e d}{r^3} \hat{x}$
- B) $k_e \left(\frac{q_0 e}{r^2} - \frac{q_0 e}{(r+d)^2} \right) \hat{x}$
- C) $k_e \frac{q_0 e d}{8r^3} \hat{x}$
- D) zero
- E) $k_e \left(\frac{2q_0 e}{r^2} - \frac{2q_0 e}{(r+d)^2} \right) \hat{x}$

5. A charged sphere with mass $M = 1.0 \times 10^{-15} \text{ kg}$ and unknown charge Q is suspended in a uniform electric field of $1.0 \times 10^7 \text{ N/C}$, as shown in figure 4. Recall that the gravitational acceleration is 9.8 m/s^2 and that $1 \text{ N} = 1 \text{ kg m/s}^2$. What is the strength of the charge (sign and magnitude of Q) that is required to suspend the particle?

- A) $+ 8.8 \times 10^{-12} \text{ C}$
- B) $+9.8 \times 10^{-22} \text{ C}$
- C) $+9.8 \times 10^{-25} \text{ C}$
- D) $-9.8 \times 10^{-25} \text{ C}$
- E) $-9.8 \times 10^{-22} \text{ C}$
