LM6121/LM6221/LM6321
High Speed Buffer

General Description
These high speed unity gain buffers slew at 800 V/μs and have a small signal bandwidth of 50 MHz while driving a 50Ω load. They can drive ±300 mA peak and do not oscillate while driving large capacitive loads. The LM6121 family are monolithic ICs which offer performance similar to the LH0002 with the additional features of current limit and thermal shutdown.

These buffers are built with National's VIP™ (Vertically Integrated PNP) process which provides fast PNP transistors that are true complements to the already fast NPN devices. This advanced junction-isolated process delivers high speed performance without the need for complex and expensive dielectric isolation.

Features
- High slew rate: 800 V/μs
- Wide bandwidth: 50 MHz
- Slew rate and bandwidth 100% tested
- Peak output current: ±300 mA
- High input impedance: 5 MΩ
- LH0002H pin compatible
- No oscillations with capacitive loads
- 5V to ±15V operation guaranteed
- Current and thermal limiting
- Fully specified to drive 50Ω lines

Applications
- Line Driving
- Radar
- Sonar

### Absolute Maximum Ratings (Note 1)

If Military/Aerospace specified devices are required, please contact the National Semiconductor Sales Office/Distributors for availability and specifications.

- Supply Voltage: 36V (±18)
- Input to Output Voltage (Note 2): ±7V
- Input Voltage: ±V_{supply}
- Output Short-Circuit to GND: Continuous (Note 3)
- Storage Temperature Range: -65°C to +150°C
- Lead Temperature (Soldering, 10 seconds): 260°C
- Power Dissipation (Note 10): ±2000mW

### Operating Ratings

#### Operating Temperature Range
- LM6121H/93: -55°C to +125°C
- LM6521: -40°C to +85°C
- LM6531: 0°C to +70°C

#### Operating Supply Range
- H Package: 4.75 to ±16V
- N Package: 150°C/W
- M Package: 47°C/W
- Thermal Resistance (R_{th}), H Package: 17°C/W

### DC Electrical Characteristics

The following specifications apply for Supply Voltage = ±15V, I_{OUT} = 0, R_{L} ≥ 100 kΩ and R_{IN} = 50Ω unless otherwise noted. **Boldface** limits apply for T_{A} = T_{J} = T_{MIN} to T_{MAX}; all other limits T_{A} = T_{J} = 25°C.

Note 1: Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. DC and AC electrical specifications do not apply when operating the device beyond its rated operating conditions.

Note 2: During current limit or thermal limit, the input current will increase if the input to output differential voltage exceeds 8V. For input to output differential voltages in excess of 8V the input current should be limited to \( \pm 20 \, \text{mA} \).

Note 3: The LM6121 series buffers contain current limit and thermal shutdown to protect against fault conditions.

Note 4: The thermal resistance \( \theta_{JAS} \) of the device in the N package is measured when soldered directly to a printed circuit board, and the heatsinking pins (pins 1, 4, 5 and 8) are connected to 2 square inches of 0.025 inch copper. When installed in a socket, the thermal resistance \( \theta_{JAS} \) of the N package is 84°C/W. The thermal resistance \( \theta_{JAS} \) of the device in the N package is measured when soldered directly to a printed circuit board, and the heatsinking pins (pins 1, 2, 3, 6, 7, 8, 9, 13, 14) are connected to 1 square inch of 0.025 inch copper.

Note 5: Limits are guaranteed by testing or correlation.

Note 6: The input is biased to 2.5V and \( V_{CC} \) exists about this value. The output swing is 2 \( V_{PP} \) at all temperatures except for the A7 test at \( -55^\circ \text{C} \) where it is reduced to 1.5 \( V_{PP} \).

Note 7: Slew rate is measured with a ±11V input pulse and a 50kΩ source impedance at 25°C. Since voltage gain is typically 0.98 during a 50kΩ load, the output swing will be approximately ±11V. Slew rate is calculated for transitions between ±5V levels on both rising and falling edges. A high speed measurement is done to minimize device heating. For slew rate versus junction temperature see typical performance curves. The input pulse amplitude should be reduced to a 1V for measurements at temperature extremes. For accurate measurements, the input slew rate should be at least 1000 V/\mu s.

Note 8: The test circuit consists of the human body model of 150 pF in series with 150kΩ.

Note 9: For specification limits over the full military temperature range, see RETS6121X.

Note 10: The maximum power dissipation is a function of \( T_{JMAX}, \theta_{JAS} \), and \( T_{A} \). The maximum allowable power dissipation at any ambient temperature is \( P_{D} = \frac{T_{JMAX} - T_{A}}{\theta_{JAS}} \).

Typical Performance Characteristics \( T_{J} = 25^\circ \text{C} \), unless otherwise specified

Application Hints

POWER SUPPLY DECOUPLING
The method of supply bypassing is not critical for stability of the LM6121 series buffers. However, their high current output combined with high slew rate can result in significant voltage transients on the power supply lines if much inductance is present. For example, a slew rate of 900 V/µs into a 50Ω load produces a di/dt of 18 A/µs. Multiplying this by a wiring inductance of 50 nH (which corresponds to approximately 1/4" of 22 gauge wire) results in a 0.9V transient. To minimize this problem use high quality decoupling very close to the device. Suggested values are a 0.1 µF ceramic in parallel with one or two 2.2 µF tantalum. A ground plane is recommended.

LOAD IMPEDANCE
The LM6121 is stable to any load when driven by a 50Ω source. As shown in the Overshoot vs Capacitive Load graph, worst case is a purely capacitive load of about 1000 pF. Shunting the load capacitance with a resistor will reduce overshoot.

SOURCE INDUCTANCE
Like any high frequency buffer, the LM6121 can oscillate at high values of source inductance. The worst case condition occurs at a purely capacitive load of 50 pF where up to 100 nH of source inductance can be tolerated. With a 50Ω load, this goes up to 200 nH. This sensitivity may be reduced at the expense of a slight reduction in bandwidth by adding a resistor in series with the buffer input. A 100Ω resistor will ensure stability with source inductances up to 400 nH with any load.

OVERVOLTAGE PROTECTION
The LM6121 may be severely damaged or destroyed if the Absolute Maximum Rating of 7V between input and output pins is exceeded.

If the buffer’s input-to-output differential voltage is allowed to exceed 7V, a base-emitter junction will be in reverse-breakdown, and will be in series with a forward-biased base-emitter junction. Referring to the LM6121 simplified schematic, the transistors involved are Q1 and Q3 for positive inputs, and Q2 and Q4 for negative inputs. If any current is allowed to flow through these junctions, localized heating of the reverse-biased junction will occur, potentially causing damage. The effect of the damage is typically increased offset voltage, increased bias current, and/or degraded AC performance. Furthermore, this will defeat the short-circuit and over-temperature protection circuitry. Exceeding ±7V input with a shorted output will destroy the device.

The device is best protected by the insertion of the parallel combination of a 100 kΩ resistor (R1) and a small capacitor (C1) in series with the buffer input, and a 100 kΩ resistor (R2) from input to output of the buffer (see Figure 1). This network normally has no effect on the buffer output. However, if the buffer’s current limit or shutdown is activated, and the output has a ground-referred load of significantly less than 100 kΩ, a large input-to-output voltage may be present. R1 and R2 then form a voltage divider, keeping the input-output differential below the 7V Maximum Rating for input voltages up to 14V. This protection network should be sufficient to protect the LM6121 from the output of nearly any op amp which is operated on supply voltages of ±15V or lower.

FIGURE 1. LM6121 with Overvoltage Protection

Application Hints

HEATSINK REQUIREMENTS
A heatsink may be required with the LM6321 depending on the maximum power dissipation and maximum ambient temperature of the application. Under all possible operating conditions, the junction temperature must be within the range specified under Absolute Maximum Ratings.

To determine if a heatsink is required, the maximum power dissipated by the buffer, P(max), must be calculated. The formula for calculating the maximum allowable power dissipation in any application is \( P_{o} = \left( T_{j(max)} - T_{A}(max) \right) R_{L} \). For the simple case of a buffer driving a resistive load as in Figure 2, the maximum DC power dissipation occurs when the output is at half the supply. Assuming equal supplies, the formula is \( P_{o} = \frac{i_{b}(2V) + V^2 R_{L}}{2} \).

FIGURE 2.

The next parameter which must be calculated is the maximum allowable temperature rise, \( \Delta T_{j} \). This is calculated by using the formula:

\[ \Delta T_{j(max)} = T_{j(max)} - T_{A}(max) \]

where \( T_{j}(max) \) is the maximum allowable junction temperature

\( T_{A}(max) \) is the maximum ambient temperature

Using the calculated values for \( T_{j}(max) \) and \( P(max) \), the required value for junction-to-ambient thermal resistance, \( \theta_{j-A} \), can now be found:

\[ \theta_{j-A} = \frac{T_{j(max)} - T_{A}(max)}{P(max)} \]
Application Hints (Continued)

The heatsink for the LM6321 is made using the PC board copper. The heat is conducted from the die, through the lead frame (inside the part), and out the pins which are soldered to the PC board. The pins used for heat conduction are:
